

Membranes and geotextiles for water storage in horticulture

For the storage of water in tanks and ponds in the horticultural sector, Genap uses various types of membranes and woven fabrics.

Genatex®

To protect the geosynthetic membrane from perforation in the pond or tank

- Genatex® 700 slope protection / anti-algae tensioned cover
- Genatex® 250 floor and wall felt

Genatex® 700

A black UV-resistant PP fabric is used to protect the slope of a water pond. The material is permeable to wind and water but largely blocks harmful sunlight. The fabric weighs approximately 200 g/m² and is also used in anti-algae tensioned covers.

Genatex® 250

To protect the plastic membrane from sharp objects in the walls or bottom of the pond or tank, we use a 250 g/m² PP non-woven felt. This material combines low weight with high puncture resistance, providing optimum protection for the membrane.

Aquatex®

A complete collection of unreinforced membranes

- Aquatex® EX
- Aquatex® PVC
- Aquatex® Extreme
- Aquatex® EPDM
- Aquatex® PE

Aquatex® membranes have a sealing function to be able to store water in a pond or tank. In order to compare the materials, the main properties and applications are listed in the enclosed table.
