

Anti-algae tensioned cover for water reservoir

Genap

When water is stored in a water reservoir without a cover, algae growth and other types of contaminations generally have free reign. As a result, irrigation systems are likely to get blocked, causing all kinds of undesired consequences. An anti-algae water reservoir cover prevents contamination and keeps the water permanently clean. In addition, the storage capacity of the water reservoir is maximized, as the cover reduces wave formation and evaporation.

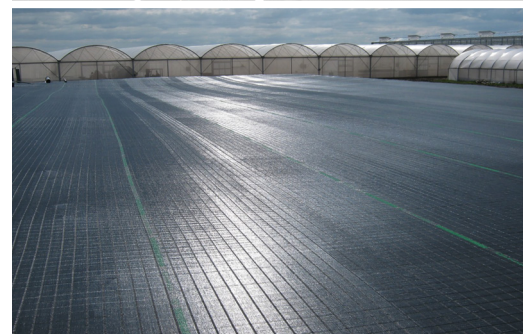

The anti-algae tensioned water reservoir cover is made of Genatex® 700, a high-quality open woven fabric that lets through water but stops dirt and light. The tensioned cover is attached to the sides using straps and a reinforced edge all around the cover. The cover is attached to poles on the outer banks of the water reservoir using ratchet straps. The cover is fully tensioned over the lagoon, resulting in complete coverage. Access is possible via a manhole that we can install upon request.

Technical data

- Material: Genatex® 700 open woven fabric
- Hardwood poles for long lifespan
- Ideal for use on water reservoirs up to a maximum width of 22 meters

Options

- Installation of a manhole
- Tensioned cover possible on both the crown and outer dike

- ✓ Maximum reduction of algae growth, wave formation, and evaporation
- ✓ Economical
- ✓ Low-maintenance
