

Water Pond Accessories

Outlets

When supply pipes are used through the wall of the pond, they are attached to the liner using a conical outlet. This consists of a base plate and a tapered sleeve, which is fixed to the pipe. This system is also available for bottom outlets. The conical outlet is fabricated from the same material as the pond liner and is available to fit all diameters of pipe.

Water Inlet Sleeve

The water inlet sleeve ensures a controlled water supply to the pond. The water is fed below the water surface by means of a flexible tube connected to the end of the inlet pipe. The sleeve is weighted with a gravel bag to prevent it being blown up. Water inlet sleeves are recommended for water pipes over the embankment of the lagoon in combination with a floating cover. They prevent water and pollution from ending up directly on the floating cover.

Bank Reinforcement

Inlet pipes are often placed next to each other resulting in a large water flow which can cause damage on the bank protection. For a longer service life, we recommend applying an extra protective layer of reinforced membrane under the inlet pipes.

Walk out safety mat

When a human or animal ends up in a basin, it is difficult for them to get out. The walk out safety mat enables a person or animal to easily climb to the top of the bank. The outlet facility consists of a rubber mat that is hung in one piece from the top or outside of the bank in the lagoon and is fixed into the bank with anchors (or with tyres to ground level).
